

Synthetic cost model

All values are fictional test data.

Decision: proposed regional design.

Current solution

Current solution 3-year cost: \$1,200,000.

Recovery is simpler to operate but slower to restore.

Proposed solution

Proposed solution 3-year cost: \$980,000.

The proposal retires duplicate tooling and automates recovery.

Supporting assumptions

The architecture notes use a 30 minute recovery estimate for a conservative exercise.

This conflicts with the deck target RTO of 15 minutes and must remain visible as a source conflict.
